RFC 9647

A YANG Data Model for Babel

Abstract

This document defines a data model for the Babel routing protocol. The data model is defined using the YANG data modeling language.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <https://www.rfc-editor.org/info/rfc9647>.

1. Introduction

This document defines a data model for [The Babel Routing Protocol \[RFC8966\]](#). The data model is defined using [YANG 1.1 \[RFC7950\]](#) and is [Network Management Datastore Architecture \(NMDA\) \[RFC8342\]](#) compatible. It is based on the [Babel information model \[RFC9046\]](#). The data model only includes data nodes that are useful for managing Babel over IPv6.

1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [\[RFC2119\]](#) [\[RFC8174\]](#) when, and only when, they appear in all capitals, as shown here.

1.2. Tree Diagram Annotations

For a reference to the annotations used in tree diagrams included in this document, please see [YANG Tree Diagrams \[RFC8340\]](#).

2. Babel Module

This document defines a [YANG 1.1 \[RFC7950\]](#) data model for the configuration and management of Babel. The YANG module is based on the [Babel information model \[RFC9046\]](#).

2.1. Information Model

There are a few things that should be noted between the Babel information model and this data module. The information model mandates the definition of some of the attributes, e.g., "babel-implementation-version" or the "babel-self-router-id". These attributes are marked as read-only objects in the information module as well as in this data module. However, there is no way in the data module to mandate that a read-only attribute be present. It is up to the implementation of this data module to make sure that the attributes that are marked "read only" and are mandatory are indeed present.

2.2. Tree Diagram

The following diagram illustrates a top-level hierarchy of the model. In addition to the version implemented by this device, the model contains subtrees on "constants", "interfaces", "mac-key-set", "dtls", and "routes".

```
module: ietf-babel

augment /rt:routing/rt:control-plane-protocols
  /rt:control-plane-protocol:
  +--rw babel!
    +--ro version?          string
    +--rw enable            boolean
    +--ro router-id?       binary
    +--ro seqno?           uint16
    +--rw statistics-enabled? boolean
    +--rw constants
      |
      | ...
    +--rw interfaces* [reference]
      |
      | ...
    +--rw mac-key-set* [name]
      |
      | ...
    +--rw dtls* [name]
      |
      | ...
    +--ro routes* [prefix]
      |
      | ...
      ...
```

The "interfaces" subtree describes attributes such as the "interface" object that is being referenced; the type of link, e.g., wired, wireless, or tunnel, as enumerated by "metric-algorithm" and "split-horizon"; and whether the interface is enabled or not.

The "constants" subtree describes the UDP port used for sending and receiving Babel messages and the multicast group used to send and receive announcements on IPv6.

The "routes" subtree describes objects such as the prefix for which the route is advertised, a reference to the neighboring route, and the "next-hop" address.

Finally, for security, two subtrees are defined to contain Message Authentication Code (MAC) keys and DTLS certificates. The "mac-key-set" subtree contains keys used with the MAC security mechanism. The boolean flag "default-apply" indicates whether the set of MAC keys is automatically applied to new interfaces. The "dtls" subtree contains certificates used with the DTLS security mechanism. Similar to the MAC mechanism, the boolean flag "default-apply" indicates whether the set of DTLS certificates is automatically applied to new interfaces.

2.3. YANG Module

This YANG module augments the [YANG routing management \[RFC8349\]](#) module to provide a common framework for all routing subsystems. By augmenting the module, it provides a common building block for routes and Routing Information Bases (RIBs). It also has a reference to an interface defined by [A YANG Data Model for Interface Management \[RFC8343\]](#).

A router running the Babel routing protocol can sometimes determine the parameters it needs to use for an interface based on the interface name. For example, it can detect that eth0 is a wired interface and that wlan0 is a wireless interface. This is not true for a tunnel interface, where the link parameters need to be configured explicitly.

For a wired interface, it will assume "two-out-of-three" is set for "metric-algorithm" and "split-horizon" is set to true. On the other hand, for a wireless interface, it will assume "etx" is set for "metric-algorithm" and "split-horizon" is set to false. However, if the wired link is connected to a wireless radio, the values can be overridden by setting "metric-algorithm" to "etx" and "split-horizon" to false. Similarly, an interface that is a metered 3G link and is used for fallback connectivity needs much higher default time constants, e.g., "mcast-hello-interval" and "update-interval", in order to avoid carrying control traffic as much as possible.

In addition to the modules used above, this module imports definitions from [Common YANG Data Types \[RFC6991\]](#) and references [HMAC: Keyed-Hashing for Message Authentication \[RFC2104\]](#), [Using HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512 with IPsec \[RFC4868\]](#), [The Datagram Transport Layer Security \(DTLS\) Protocol Version 1.3 \[RFC9147\]](#), [The BLAKE2 Cryptographic Hash and Message Authentication Code \(MAC\) \[RFC7693\]](#), [Babel Information Model \[RFC9046\]](#), [The Babel Routing Protocol \[RFC8966\]](#), [YANG Data Types and Groupings for Cryptography \[RFC9640\]](#), [Network Configuration Access Control Model \[RFC8341\]](#), and [MAC Authentication for the Babel Routing Protocol \[RFC8967\]](#).

3. IANA Considerations

3.1. URI Registration

IANA has registered the following URI in the "ns" registry of the "IETF XML Registry" [[RFC3688](#)].

URI: urn:ietf:params:xml:ns:yang:ietf-babel

Registrant Contact: The IESG

XML: N/A; the requested URI is an XML namespace.

3.2. YANG Module Name Registration

IANA has registered the following in the "YANG Module Names" registry [[RFC6020](#)].

Name: ietf-babel

Namespace: urn:ietf:params:xml:ns:yang:ietf-babel

Prefix: babel

Reference: RFC 9647

4. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as [NETCONF](#) [[RFC6241](#)] or [RESTCONF](#) [[RFC8040](#)]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is [SSH](#) [[RFC6242](#)]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is [TLS](#) [[RFC8446](#)].

The Network Configuration Access Control Model ([NACM](#) [[RFC8341](#)]) provides the means to restrict access for particular NETCONF users to a preconfigured subset of all available NETCONF protocol operations and content.

The security considerations outlined here are specific to the YANG data model and do not cover security considerations of the Babel protocol or its security mechanisms in [The Babel Routing Protocol \[RFC8966\]](#), [MAC Authentication for the Babel Routing Protocol \[RFC8967\]](#), and [Babel Routing Protocol over Datagram Transport Layer Security \[RFC8968\]](#). Each of these has its own Security Considerations section for considerations that are specific to it.

There are a number of data nodes defined in the YANG module that are writable/created/deleted (i.e., `config true`, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., `<edit-config>`) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability from a `config true` perspective:

'`babel`': This container includes an 'enable' parameter that can be used to enable or disable use of Babel on a router.

'`babel/constants`': This container includes configuration parameters that can prevent reachability if misconfigured.

'`babel/interfaces`': This leaf-list has configuration parameters that can enable/disable security mechanisms and change performance characteristics of the Babel protocol. For example, enabling logging of packets and giving unintended access to the log files gives an attacker detailed knowledge of the network and allows it to launch an attack on the traffic traversing the network device.

'`babel/hmac`' and '`babel/dtls`': These contain security credentials that influence whether incoming packets are trusted and whether outgoing packets are produced in such a way that the receiver will treat them as trusted.

Some of the readable data or `config false` nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via `get`, `get-config`, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability from a `config false` perspective:

'`babel`': Access to the information in the various nodes can disclose the network topology. Additionally, the routes used by a network device may be used to mount a subsequent attack on traffic traversing the network device.

'`babel/hmac`' and '`babel/dtls`': These contain security credentials, including private credentials of the router; however, it is required that these values not be readable.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability from an RPC operation perspective:

This model defines two actions. Resetting the statistics within an interface container would be visible to any monitoring processes, which should be designed to account for the possibility of such a reset. The "test" action allows for validation that a MAC key and MAC algorithm have been

properly configured. The MAC key is a sensitive piece of information, and it is important to prevent an attacker that does not know the MAC key from being able to determine the MAC value by trying different input parameters. The "test" action has been designed to not reveal such information directly. Such information might also be revealed indirectly due to side channels such as the time it takes to produce a response to the action. Implementations **SHOULD** use a constant-time comparison between the input MAC and the locally generated MAC value for comparison in order to avoid such side channel leakage.

```

A.2. Statistics Gathering Enabled

In this example, interface eth0 is being configured for routing protocol Babel, and statistics gathering is enabled. For security, HMAC-SHA256 is supported. Every sent Babel packet is signed with the key value provided, and every received Babel packet is verified with the same key value.

```

<?xml version="1.0" encoding="UTF-8"?>
<interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-interfaces"
  xmlns:ianaift="urn:ietf:params:xml:ns:yang:iana-if-type">
  <interface>
    <name>eth0</name>
    <type>ianaift:ethernetCsmacd</type>
    <enabled>true</enabled>
  </interface>
</interfaces>
<routing
  xmlns="urn:ietf:params:xml:ns:yang:ietf-routing">
  <control-plane-protocols>
    <control-plane-protocol>
      <type
        xmlns:babel=
          "urn:ietf:params:xml:ns:yang:ietf-babel">babel:babel</type>
      <name>name:babel</name>
      <babel
        xmlns="urn:ietf:params:xml:ns:yang:ietf-babel">
        <enable>true</enable>
        <statistics-enabled>true</statistics-enabled>
        <interfaces>
          <reference>eth0</reference>
          <metric-algorithm>two-out-of-three</metric-algorithm>
          <split-horizon>true</split-horizon>
        </interfaces>
        <mac-key-set>
          <name>hmac-sha256</name>
          <keys>
            <name>hmac-sha256-keys</name>
            <use-send>true</use-send>
            <use-verify>true</use-verify>
            <value>base64encodedvalue==</value>
            <algorithm>hmac-sha256</algorithm>
          </keys>
        </mac-key-set>
      </babel>
    </control-plane-protocol>
  </control-plane-protocols>
</routing>

```

A.3. Automatic Detection of Properties

```

<!-- In this example, babeld is configured on two interfaces

```

```

  interface eth0
  interface wlan0

```

```

  This says to run Babel on interfaces eth0 and wlan0. Babeld will
  automatically detect that eth0 is wired and wlan0 is wireless and
  will configure the right parameters automatically.

```

```

-->

```

```

<?xml version="1.0" encoding="UTF-8"?>
<interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-interfaces"

```

```

        xmlns:ianaift="urn:ietf:params:xml:ns:yang:iana-if-type">
    <interface>
      <name>eth0</name>
      <type>ianaift:ethernetCsmacd</type>
      <enabled>true</enabled>
    </interface>
    <interface>
      <name>wlan0</name>
      <type>ianaift:ieee80211</type>
      <enabled>true</enabled>
    </interface>
  </interfaces>
  <routing
    xmlns="urn:ietf:params:xml:ns:yang:ietf-routing">
    <control-plane-protocols>
      <control-plane-protocol>
        <type
          xmlns:babel=
            "urn:ietf:params:xml:ns:yang:ietf-babel">babel:babel</type>
        <name>name:babel</name>
        <babel
          xmlns="urn:ietf:params:xml:ns:yang:ietf-babel">
          <enable>true</enable>
          <interfaces>
            <reference>eth0</reference>
            <enable>true</enable>
            <metric-algorithm>two-out-of-three</metric-algorithm>
            <split-horizon>true</split-horizon>
          </interfaces>
          <interfaces>
            <reference>wlan0</reference>
            <enable>true</enable>
            <metric-algorithm>etx</metric-algorithm>
            <split-horizon>false</split-horizon>
          </interfaces>
        </babel>
      </control-plane-protocol>
    </control-plane-protocols>
  </routing>

```

A.4. Override Default Properties

<!-- In this example, babeld is configured on three interfaces

```

interface eth0
interface eth1 type wireless
interface tun0 type tunnel

```

Here, interface eth1 is an Ethernet bridged to a wireless radio, so babeld's autodetection fails, and the interface type needs to be configured manually. Tunnels are not detected automatically, so this needs to be specified.

This is equivalent to the following:

```

interface eth0 metric-algorithm 2-out-of-3 split-horizon true

```

```
interface eth1 metric-algorithm etx split-horizon false
interface tun0 metric-algorithm 2-out-of-3 split-horizon true
-->

<?xml version="1.0" encoding="UTF-8"?>
<interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-interfaces"
  xmlns:ianaift="urn:ietf:params:xml:ns:yang:iana-if-type">
  <interface>
    <name>eth0</name>
    <type>ianaift:ethernetCsmacd</type>
    <enabled>true</enabled>
  </interface>
  <interface>
    <name>eth1</name>
    <type>ianaift:ethernetCsmacd</type>
    <enabled>true</enabled>
  </interface>
  <interface>
    <name>tun0</name>
    <type>ianaift:tunnel</type>
    <enabled>true</enabled>
  </interface>
</interfaces>
<routing
  xmlns="urn:ietf:params:xml:ns:yang:ietf-routing">
  <control-plane-protocols>
    <control-plane-protocol>
      <type
        xmlns:babel=
          "urn:ietf:params:xml:ns:yang:ietf-babel">babel:babel</type>
      <name>name:babel</name>
      <babel
        xmlns="urn:ietf:params:xml:ns:yang:ietf-babel">
        <enable>true</enable>
        <interfaces>
          <reference>eth0</reference>
          <enable>true</enable>
          <metric-algorithm>two-out-of-three</metric-algorithm>
          <split-horizon>true</split-horizon>
        </interfaces>
        <interfaces>
          <reference>eth1</reference>
          <enable>true</enable>
          <metric-algorithm>etx</metric-algorithm>
          <split-horizon>false</split-horizon>
        </interfaces>
        <interfaces>
          <reference>tun0</reference>
          <enable>true</enable>
          <metric-algorithm>two-out-of-three</metric-algorithm>
          <split-horizon>true</split-horizon>
        </interfaces>
      </babel>
    </control-plane-protocol>
  </control-plane-protocols>
</routing>
```

A.5. Configuring Other Properties

```
<!-- In this example, two interfaces are configured for babeld
```

```
interface eth0
interface ppp0 hello-interval 30 update-interval 120
```

Here, ppp0 is a metered 3G link used for fallback connectivity. It runs with much higher than default time constants in order to avoid control traffic as much as possible.

```
-->
```

```
<?xml version="1.0" encoding="UTF-8"?>
<interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-interfaces"
            xmlns:ianaift="urn:ietf:params:xml:ns:yang:iana-if-type">
  <interface>
    <name>eth0</name>
    <type>ianaift:ethernetCsmacd</type>
    <enabled>true</enabled>
  </interface>
  <interface>
    <name>ppp0</name>
    <type>ianaift:ppp</type>
    <enabled>true</enabled>
  </interface>
</interfaces>
<routing
  xmlns="urn:ietf:params:xml:ns:yang:ietf-routing">
  <control-plane-protocols>
    <control-plane-protocol>
      <type
        xmlns:babel=
          "urn:ietf:params:xml:ns:yang:ietf-babel">babel:babel</type>
      <name>name:babel</name>
      <babel
        xmlns="urn:ietf:params:xml:ns:yang:ietf-babel">
        <enable>true</enable>
        <interfaces>
          <reference>eth0</reference>
          <enable>true</enable>
          <metric-algorithm>two-out-of-three</metric-algorithm>
          <split-horizon>true</split-horizon>
        </interfaces>
        <interfaces>
          <reference>ppp0</reference>
          <enable>true</enable>
          <mcast-hello-interval>30</mcast-hello-interval>
          <update-interval>120</update-interval>
          <metric-algorithm>two-out-of-three</metric-algorithm>
        </interfaces>
      </babel>
    </control-plane-protocol>
  </control-plane-protocols>
</routing>
```

Acknowledgements

Juliusz Chroboczek provided most of the example configurations for babel that are shown in [Appendix A](#).
