

Computer program written by authors. Authors can read and write program in form known as "source code", which is easy to modify

Source code

```
for ( int i=1; i<2; i++)  
{  
    cerr <<  
    "Testing" << i;  
}  
  
return 1;
```

Compilation

Computer Program

Application only runs only on the O/S & CPU it was compiled for.
Cannot be modified

A separate program is used to convert the "source" representation into final program run by a particular OS and CPU.
This cannot be undone.
